

Files & Permissions

File, directory and inode

- ▶ **File:** A file represents a sequence of bytes.
 - ▶ Each file will have a name
 - ▶ Special characters are allowed but need to be used carefully
- ▶ **Directory:** A directory represents a list of files.
 - ▶ **A directory is also a file** which contains the list of files containing in it.
Every directory and file will be listed in its parent directory
- ▶ **Inode:** An inode (Index Node) contains information about a file (metadata) File permissions, UID, GID, Size, Time Stamp etc.

Permissions

► **File Permissions:** There are 3 permissions for any file r, w, x.

1. **Read (r)** - Indicates that a given category of user can read a file.
2. **Write (w)** - Indicates that a given category of user can write to a file.
3. **Execute (x)**- Indicates that a given category of user can execute the file.

► **Directory permissions:**

1. **Read (r)** - The directory can be read.
2. **Write (w)** - The directory can be updated, renamed or deleted.
3. **Execute (x)**- Operations can be performed on the files of the directories. This bit is also called as search bit, it indicates whether you are permitted to search files under that directory

► **Categories of users:** All of these three permissions are assigned to three

► categories of users User (U), Group(G), Others(O)

File types

File Type	Symbol	Created by	Removed by
Regular file	-	Editors, cp, etc..	rm
Directory	d	mkdir	rmdir, rm -f
Character device file	c	mknod	rm
Block device file	b	mknod	rm
UNIX domain socket	s	socket(2)	rm
Named pipe	p	mknod	rm
Symbolic link	l	ln -s	rm

File Types Table

File Permissions

- ◆ Each file has a set of permissions that control who can mess with the file.
- ◆ There are three types of permissions:
 - read abbreviated **r**
 - write abbreviated **w**
 - execute abbreviated **x**
- ◆ There are 3 sets of permissions:
 1. user
 2. group
 3. other (the world, everybody else)

Access Permissions...

- rwxrwxrwx

Read, write, and execute permissions for all other users.

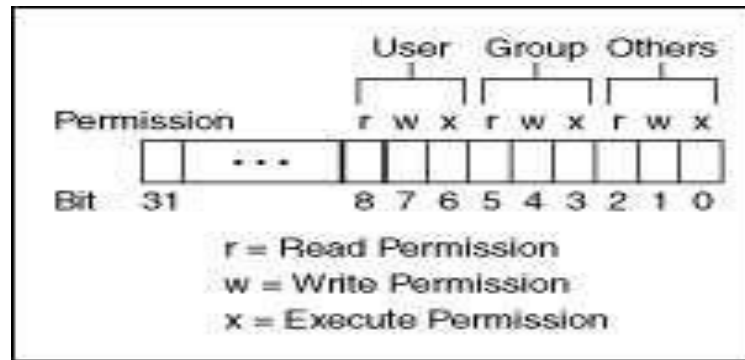

Read, write, and execute permissions for the group owner of the file.

Read, write, and execute permissions for the file owner.

File type:
- indicates regular file
d indicates directory

u g o
754

access	r	w	x	r	w	x	r	w	x
binary	4	2	1	4	2	1	4	2	1
enabled	1	1	1	1	0	1	1	0	0
result	4	2	1	4	0	1	4	0	0
total	7			5			4		

ls -l permissions

▶ — **rwxrwxrwx**

▶ User

Group

Others

- ▶ **Type of file:**
- ▶ **-plain file d directory**
- ▶ **s symbolic link (others)**

r w x permissions

► Directory:

- r - allowed for listing
- w - allowed for add or remove files
- x - allowed to enter the directory

► Files:

- R - allowed to read
- W - allowed to write
- X - allowed to execute

Change permissions

- ▶ “chmod” is the command to change the permissions for file and directory
 - ▶ Syntax : `chmod xxx <filename>`

Chmod with numeric value

- ▶ Consider for user
 - ▶ r - 4
 - ▶ w - 2
 - ▶ x - 1
- ▶ Consider for user, group and other
 - ▶ 755 - rwxrw_rw_
 - ▶ 611 - rw___x__x

chmod examples

- ▶ `$ chmod 700 CS571`
- ▶ `$ ls Personal`
- ▶ `drwx----- 10 kschmidt 4096 Dec 19 2004 CS571/`
- ▶ `$ chmod 755 public_html`
- ▶ `$ chmod 644 public_html/index.html`
- ▶ `$ lsao public_html`

chmod - symbolic modes

- ▶ Symbolic modes
 - ▶ U - user
 - ▶ G - group
 - ▶ O - other
 - ▶ A - all
 - ▶ + add permission
 - ▶ - remove permission
 - ▶ = set permission

File links

- ▶ Hard links
- ▶ Symbolic links

Hard links

- ▶ Hard link is a **reference** to the physical data on
- ▶ a file system
- ▶ All named files are hard links
- ▶ More than one name can be associated with
- ▶ the same physical data
- ▶ Hard links can only refer to data that exists on the **same** file system
- ▶ You can **not** create hard link to a directory

Soft links

- ▶ Also Known As Soft links or Symlinks
- ▶ A **Symbolic Link** is an indirect pointer to a file
- ▶ You can create a symbolic link to a **directory**
- ▶ A symbolic link can point to a file on a **different file system**
- ▶ A symbolic link can point to a nonexistent file
